HEAT EXCHANGER

DNA SHELL & TUBE HEAT EXCHANGER

DNA heat exchangers represent next step in the evolution of tubular heat exchangers.

They deliver significant benefits in the areas of fluid dynamics and heat transfer while maintaining the features and benefits of traditional shell & tube design.

Thanks to its special geometry, the heat transfer coefficient in the tube side achieves up to double values. This advantage can be used for high viscosity media to increase the overall performance of the unit.

DNA achieves significantly higher heat transfer rates comparing to standard solution. The design of the unit allows for more efficient operation in high volume applications (e.g. flue gas, hot air, low pressure steam).

The construction of the DNA heat exchanger enables to obtain smaller and lighter device. At the same time, the exchanger retains all the advantages of the shell & tube heat exchanger, especially its high mechanical strength.

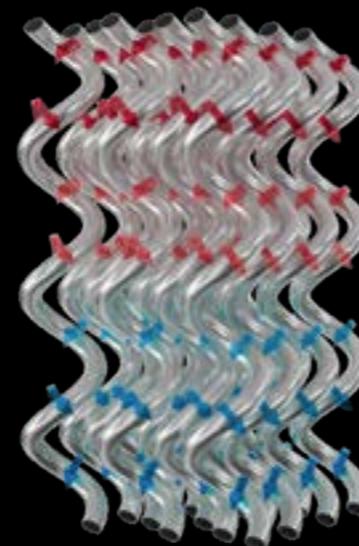

DNA TUBE BUNDLE FEATURES

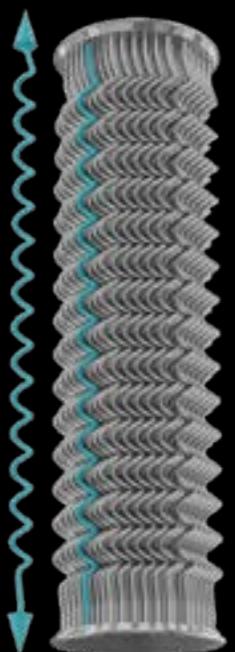

1

Effective turbulent vortex flow increases heat transfer coefficient up to double values due to helical tube geometry.

2

Effective heat transfer area with more homogeneous distribution of flow and velocity field.

3

Flexible tube bundle, low pressure drop, no dead spots, baffle-free, no need of shell compensator and elimination of vibration due to the multiple contact points along the tube bundle.

DNA HEAT EXCHANGER ADVANTAGES

EFFECTIVE
HEAT TRANSFER
AREA

TURBULENT
VORTEX FLOW

LOW
PRESSURE DROP

LARGE HEAT
TRANSFER AREA
CONTAINED IN COMPACT
CONSTRUCTION

MADE OF STAINLESS STEEL

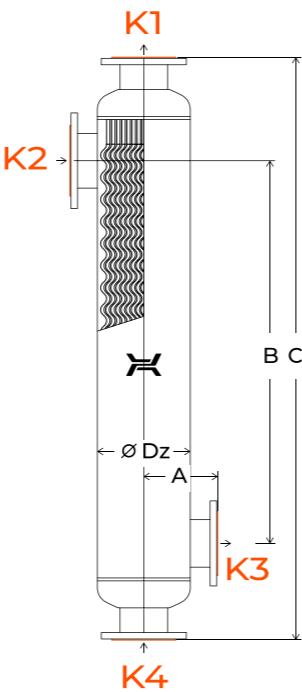

RESISTANT TO CORROSION

TECHNICAL DATA

K4 / K1 – inlet / outlet cold side

K2 / K3 – inlet / outlet hot side

INSTALLATION TYPES

DNA heat exchangers can be installed **vertically** or **horizontally** depending on the application and available space.

SHELL & TUBE HEAT EXCHANGER

APPLICATION

- low pressure steam condensers (flash steam condensers)
- industrial and chemical processes
- recuperation and regeneration in industrial technologies
- waste heat recovery – diesel and gas engines, cogeneration systems
- water and steam systems, cooling circuits

CONSTRUCTION

- heat transfer area created by identical helical tubes of diameter Ø 0.39 in / 10 mm
- many contact points along the tubes provide high resistance of tube bundle against possible vibrations
- non-baffle design with a homogeneous tube-bundle

WORKING PARAMETERS

- max. temp.: 392°F / 200°C
- min. temp.: -4°F / -20°C
- max. pressure shell side: 145 psi / 10 bar
- max. pressure tube side: 232 psi / 16 bar

MATERIAL TYPE

stainless steel AISI 316L / 1.4404

MEDIA

water, steam, glycol, flue gas, air, ammonia, acetone, toluene, synthetic oils and other media after consulting the manufacturer

CERTIFICATES

manufactured in accordance with PED, ASME, EAC, China ML
